MyTech v2

USER ACCEPTANCE TESTING / BUG FIX SUMMARY

INT6137 · 12 October 2026 · Report v1.0 · Post-PR #12 baseline

8 / 8	1	2
Final UAT scenarios	Fixed bug / live regression	Outstanding UX items

1 Executive summary

Eight documented manual UAT scenarios reached **PASS** as final recorded outcomes. The first five passed initially. UAT-06, a missing-information clarification request, failed twice with HTTP 502 / MODEL_OUTPUT_NOT_JSON. After a targeted parser compatibility fix, offline tests, independent review, PR #12 and CI, UAT-06 passed a live regression. Two more turns (UAT-07 and UAT-08) successfully completed context-aware requirements collection and product recommendation.

How to read 8/8: This is the final outcome for eight selected scenarios, not a first-attempt pass rate, statistical accuracy figure, or guarantee for untested inputs. The two original UAT-06 failures remain in the record.

2 System and scope

Test route: local Windows browser → MyTech v2 frontend (127.0.0.1:8787) → Node.js server → published school FastGPT workflow. The API credential stays server-side. Recommendations are based on a fixed classroom catalogue of **27 products across nine categories**, not live retailer pricing.

The structured response contract contains answer, recommendations, next_step, and clarification_needed. Manual scenarios exercised initial recommendations, relative follow-ups, budget changes, simultaneous product requests, no-match behavior, clarification, session context and UI product cards.

Not in scope: formal load/security/accessibility testing, comprehensive browser/device coverage, or live retailer price verification.

Code baseline: main at da6e43de21431a5befed3aebd6489ddc1d9c072a (12 October 2026 merge).

3 UAT scenario results

UAT-01 to UAT-05 input descriptions are reconstructed from the testing notes rather than presented as verbatim messages. Exact text is used where recorded for UAT-06 through UAT-08.

ID	Input / scenario	Observed outcome	Final
01	Laptop · study/office · cap ¥6,000	Lenovo Xiaoxin 14 (2025), ¥5,799; card rendered	PASS
02	Same session · cheaper laptop	No cheaper catalogue match; no invented alternative	PASS
03	Same session · cap raised to ¥7,000; different laptop	HUAWEI MateBook 14, ¥6,599	PASS
04	New session · study/office Laptop ≤¥6,000 + gaming Mouse ≤¥300	Lenovo Xiaoxin 14 ¥5,799 and Logitech G304 ¥229	PASS
05	New session · gaming Mouse ≤¥100	No matching card; G304 ¥229 identified as over budget	PASS
06	“I’m thinking about buying a laptop. What would you recommend?”	Pre-fix: two failures; post-fix: asked main laptop usage, no card	PASS after fix
07	“Mostly for studying and office work.”	Retained laptop request; asked for budget	PASS
08	“My maximum budget is RMB 6,000.”	Retained study/office context; Lenovo Xiaoxin 14 ¥5,799	PASS

Observed clarification journey

Stage	Observed response
UAT-06 · Category known, details missing	“What will you mainly use the laptop for?”
UAT-07 · Use case supplied	“What is your budget for the laptop?”
UAT-08 · Budget supplied	Recommended Lenovo Xiaoxin 14 at ¥5,799, within ¥6,000 cap

Recorded sequence: UAT-01–05 PASS; UAT-06 FAIL twice before the fix, then PASS once after the fix; UAT-07–08 PASS in the same post-fix conversation.

4 BUG-01: clarification JSON compatibility

Status: Fixed in code; live regression passed for the previously failing input. **User impact:** A safe error appeared instead of a clarification; the interface did not invent a recommendation.

4.1 Evidence from the original failure

- Exact request: “I’m thinking about buying a laptop. What would you recommend?”
- Two pre-fix attempts failed; Network showed **HTTP 502** and `MODEL_OUTPUT_NOT_JSON`.
- FastGPT log extracted Laptop; budget and main use were null; clarification was required.
- The logged clarification object was structurally valid with an empty recommendations array.
- Copying the FastGPT UI reply included a Markdown `json` code fence.

Evidence boundary: Raw historical choices[0].message.content was not captured. The copied UI text does not prove that the raw API payload contained the fence.

4.2 Confirmed parser gap and fix

The original parseFastGptResponse() passed the complete content directly to JSON.parse(). A complete Markdown-fenced JSON object would fail. The portable workflow export also showed asymmetric formatting paths for recommendation and clarification; it does not establish an exact deployed-workflow match.

- Accept existing plain valid JSON and **one entire lowercase `json` fenced block** (LF/CRLF, optional outer whitespace).
- Continue parsing the full enclosed document with `JSON.parse`; reject prose, reasoning tags, multiple blocks, unsupported fences and malformed JSON.
- Keep existing normalization, four-field contract, product identity, category, exact price, source, hard-budget, usage and live-claim checks.

Scope: Only mytech_response.mjs and tests/response.test.mjs changed. No UI, Node integration, FastGPT workflow, product catalogue or knowledge-base modifications.

4.3 Review, CI and regression

Item	Verified record
Feature commit	cc589809947a721369dfe5e382d2864f4f25945a
PR / Merge	PR #12 · merged 12 Oct 2026 · merge da6e43de21431a5befed3aebd6489ddc1d9c072a
Offline tests	13/13 response · 21/21 Node.js · 224/224 Python
Data / knowledge	27 products / 9 categories valid · 27 knowledge records consistent
Actions	Ubuntu, Windows, macOS CI + Ubuntu Response Tests: all Success
Live regression	Original UAT-06 prompt returned a normal clarification; UAT-07 and -08 passed

Closure: “Fixed — Live Regression Passed” for this test path. Original malformed API bytes remain unknown; broader reliability is not inferred.

5 Outstanding UX backlog

UX-01 | Redundant reference-price paragraph

Observed: “Fixed reference prices for the classroom prototype. They are not live retailer quotes. MyTech should describe them as reference prices.”

The string is the product dataset’s price_note, inserted under product cards by the frontend. Its final sentence is internal-style guidance, not customer copy. The card already says “Reference price”, and the page footer says the catalogue is not live retailer pricing.

Proposed review: Remove this duplicate chat paragraph while keeping visible price-reference disclosures and dataset accuracy. **Not implemented.**

UX-02 | Generic next-step wording

Observed: “Would you like a cheaper or more expensive option, or does this meet your needs?”

This comes from FastGPT’s next_step field, displayed by the frontend. It may suggest that matching cheaper or more expensive options exist despite the active budget and fixed catalogue.

Proposed review: Consider context-aware wording such as “Does this option meet your needs, or would you like to adjust your budget or preferences?” Test follow-up routing before any change. **Not implemented.**

Documentation-only housekeeping

README Node.js test-count text remains at the pre-fix figure of 16; the current suite has 21 tests. Update in a separate documentation change.

6 Limits, next actions and overall assessment

- **Eight selected scenarios, not model accuracy:** No statistical generalization or first-attempt perfect-pass claim.
- **Output variability:** One successful live regression does not guarantee future runs or identical wording.
- **Uncaptured original payload:** The historical byte-level cause of UAT-06 cannot be asserted.
- **Static prices:** The catalogue is a classroom reference; actual market prices may differ.
- **Quality coverage:** No formal load, penetration, accessibility or extensive device-matrix test.
- **Next:** Freeze the passing baseline; perform a READ-ONLY UX review, then separately approve, implement, test, review and merge targeted polish.

Overall decision: All eight selected UAT scenarios reached final acceptance after BUG-01 remediation. PR #12 has passed independent review, merge and cross-platform CI, and the original clarification failure no longer appeared in the live regression. UX-01 and UX-02 remain non-blocking follow-ups.

7 Evidence and traceability

Manual UAT screenshots and testing notes (12 October 2026); browser Network HTTP 502 record; school FastGPT conversation log; source review; GitHub PR #12 and associated Actions; merged baseline da6e43de2143.
